Windows OS Startup Notification & Calendar Sync Guide

This guide explains how to enable and use the native Windows desktop alerts and calendar integration. Follow these steps to set it up on your computer.

1. Windows OS Startup Notifications

This feature pops up native Windows desktop alerts displaying new, upcoming, or overdue tasks immediately when you turn on your computer or log into Windows.

How to Enable (One-Click Setup):

1. Log in to your account at `http://localhost:8080`.
2. Click on the **Settings** gear icon in the top-right corner.
3. Select the **Notifications** tab.
4. Scroll down to the **Windows OS Startup Notifications** section.
5. Click the **Register OS Startup Alerts** button.
6. A Windows User Account Control (UAC) popup will appear on your desktop asking to run Windows PowerShell as Administrator. Click **Yes** to authorize the installer.
7. **Done!** The system will automatically configure the background task.

How it works: A silent background task named `MGGStartupNotifier` is registered in your Windows Task Scheduler. Every time you log in, it checks the server and displays native OS Toast Notifications for your specific assignments.

2. Dynamic Calendar Integration

This feature automatically syncs your task deadlines directly into your built-in Windows Calendar, Outlook, Google Calendar, or Apple Calendar.

Option A: Automatic Sync (Recommended)

1. Log in and navigate to the **Settings → Calendar Sync** tab.

2. Click the **Sync Automatically** button. Your calendar file (`tasks.ics`) will download.
3. **Click the downloaded file** in your browser's download manager.
4. Windows will launch your default Calendar app and automatically link all your task deadlines.

Option B: Subscribe via Link (For Google Calendar or Outlook Web)

1. Copy your custom iCalendar URL from the **Calendar Sync** tab.
2. Open your calendar application (e.g. Google Calendar), select **From URL**, paste the link, and click **Add Calendar**.

Troubleshooting

- **Server Status:** The local backend server must be running (`npm run dev` in the backend folder) for notifications and sync feeds to load.
- **Manual Installation:** If the automatic button fails to show a prompt, open PowerShell as Administrator and run the installer script manually:

```
powershell.exe -ExecutionPolicy Bypass -File .\install_notifier_task.ps1
```
